Use Crank-Nicolson method to solve for the temperature distribution in a long, thin rod with a length of 10 cm and following values:  $k'=0.49$  cal/(sec.cm.°C) and  $A\tau=0.5$  sec. At  $t=0$  sec (initial condition), the temperature of the entire rod, including the left and right boundaries, is 100°C with the right boundary also insulated ( $dT/dx = 0$  °C/cm) and the boundary condition is fixed for all ...

The linear algebraic system of equations generated in Crank-Nicolson method for any time level  $t_{n+1}$  are sparse because the finite difference equation obtained at any space node, say  $i$  and at time level  $t_{n+1}$  has only three unknown coefficients involving space nodes ' $i-1$ ', ' $i$ ' and ' $i+1$ ' at  $t_{n+1}$  time level, so in matrix notation these equations can be written as  $AU=B$ , where  $U$  is the unknown ...
