Locked intramedullary nailing has transformed the management of long bone fractures. Intramedullary nails act as load-sharing devices in fractures and are subjected to smaller bending loads than plates. Thus, they are less vulnerable to fatigue failure and patients can be mobilized as early as the first postoperative day.

## COMMONLY ASKED QUESTIONS ON THE PRACTICE OF INTRAMEDULLARY

...

An intramedullary rod, also known as an intramedullary nail or inter-locking nail or Küntscher nail, is a metal rod forced into the medullary cavity of a bone. IM nails have long been used to treat fractures of long bones of the body.

Gerhard Küntscher is credited with the first use of this device in 1939, during World War II, for soldiers with fractures of the femur. Prior to that, treatment of
