Potash — The broadview project

Solution mining is different from the conventional underground mining method, which has been widely used in North America. Solution mining of potash ore involves injecting heated solvent into the underground potash ore via drill holes to dissolve potash. The dissolved salts are then pumped out of the cavern to a processing plant where the brine is evaporated and crystallized, leaving behind the potassium chloride.

What is Solution Mining? SMRI views solution mining as mining of underground, water-soluble minerals, usually using one or more drilled wells to dissolve the minerals with water (not by using acids used in metal ore leaching). Minerals such as salt, potash, trona, and magnesium salts may be produced by pumping saturated fluid from underground caverns.

An Introduction to Potash Solution Mining | Nasdaq

With solution mining, a brine is heated and injected into the deposit to dissolves the potash. The potash-rich brine is then pumped out of the cavern to the surface where the water is evaporated. Solution mining involves dissolution of the potash with water.

Potash is extracted from buried ancient evaporites by underground or solution mining. This accounts for most of the potassium produced. Another important source is brine from land-locked water bodies, such as the Dead Sea, Salar de Atacama or Great Salt Lake. About 95% of potash produced worldwide is used in agriculture. The rest is found in several

We estimate that the break-even potash price for a solution mine is US\$200/t and for a conventional underground mine US\$235/t. A Saskatchewan Greenfield potash mine requires a potash price of US\$435/t to earn a 15% internal rate of return (IRR) for solution mining and US\$580/t for a conventional underground mine.

Solution Mining Potash

Potash solution mining is ideal when ore is found more than 1,000 meters below ground level and when dealing with sedimentary rock. In those circumstances, the depth and rock type make conventional mining risky and dangerous. Safety — Safety is a key concern that is addressed by solution mining.

Production. Potash ores are typically rich in potassium chloride (KCl), sodium chloride (NaCl) and other salts and clays, and are typically obtained by conventional shaft mining with the extracted ore ground into a powder. Other methods include dissolution mining and evaporation methods from brines.
