The basic unit of force in structural and stress analysis is the Newton (N) which is roughly a tenth of the weight of this book. This is a rather small unit for most of the loads in structural engineering so a more convenient unit, the kilonewton (kN) is often used.  $1\text{kN} = 1000\text{N}$  All bodies possess mass which is usually measured in kilograms (kg). The mass of a

Publisher Summary. This chapter discusses the principles of statics that are essential to structural and stress analysis. A force is a vector that may be represented graphically, where the force  $F$  is considered to be acting on an infinitesimally small particle at the point  $A$  and in a direction from left to right. The magnitude of  $F$  is represented, to a suitable scale, by the length of the line ...
